

## In the Claims:

Please amend the claims as follows (the changes in these claims are shown with ~~striketrough~~ for deleted matter and underlines for added matter). A complete listing of the claims with proper claim identifiers is set forth below.

1. (Currently Amended) An apparatus/a medical utensil (1) for adjustment of the length of an infusion tubing (2), comprising a housing (3) with an axle/cylinder part (4) arranged about a centre axis, said housing (3) further comprising at least one turnable unit (6) and a first axle (9), the centre axis of which coincides with the centre axis of the axle (4), and about which axle (9) the turnable unit (6) turns, characterised in that the turnable unit (6) comprises a turnable first plate - partition plate 10 - which is turnable about the first axle (9) and a wheel/cylinder part (11) turnable about the same axle (9); and in that, at its periphery, the partition plate (10) comprises a circular plate/wheel - return wheel (12) - around the periphery of which lengths of the tubing abut.

2. (Original) An apparatus according to claim 1, characterised in that, said axle/cylinder part (4) and wheel/cylinder part (11) are rotatable relative to each other.

3. (Currently Amended) An apparatus according to claim 1 ~~or 2~~ , characterised ~~in that~~ wherein the axle (4) is a stationary axle.

4. (Currently Amended) An apparatus according to claim 1 ~~or 2~~ , characterised ~~in that~~ wherein the axle (4) cylinder part is a turnable axle.

5. (Currently Amended) An apparatus according to ~~any one of the preceding claims, characterised in that~~ claim 1, wherein the return wheel (12) is turnable about an axle mounted on the partition plate.

6. (Currently Amended) An apparatus according to ~~any one of the preceding claims, characterised in that~~ claim 1, wherein the apparatus comprises a spring, said spring being connected to the partition plate (10) and to a part which is stationary within the housing (3), preferably the walls of the housing (3).

7. (Currently Amended) An apparatus according to ~~any one of the preceding claims, characterised in that~~ claim 1, wherein the diameter of the axle/the cylinder part (4) and the turnable cylinder part (11) are essentially identical.

8. (Original) A method for adjustment of the length of an infusion tubing (2) by means of an apparatus comprising a housing (3) with an axle/cylinder part (4) arranged about a centre axis, said housing (3) further comprising at least one turnable unit (6) and a first axle (9), the centre axis of which coincides with the centre axis of the axle (4), and about which axle (9) the turnable unit (6) turns, said turnable unit (6) comprising a turnable first plate - partition plate 10 - which is turnable about first axle (9) and a wheel/cylinder part (11) turnable about the same axle (9), **characterised in** that a first length of tubing is wound around the axle (4); that a second length of tubing (18) is wound around the wheel/cylinder part (11); that a first free end part (7) and a second free end part (8) are positioned exteriorly of the housing, and that said turnable first plate (10) comprises a circular plate/wheel (12) at its periphery where said second end part is conveyed around said return wheel (12) associated with the turnable unit and the turnable wheel/cylinder part (11).

9. (Original) A method according to claim 8; **characterised in** that tubing situated around the axle (4) is transferred to the turnable unit (6) and conversely during adjustment/unwinding of the length of the tubing.

10. (Currently Amended) A method according to ~~any one of claims 8-9, characterised in that~~ claim 8, wherein the tubing is wound about the axle in a first direction and wound around parts of the turnable unit in a second direction opposite the first direction.

11. Cancelled.

12. Cancelled.
